PROBLEM STATEMENT #60

1. Problem Context & Overview

A media production organizer that allows podcast hosts to share booking availability, collect guest talking-point outlines, and generate timestamped run-of-show episode production notes. The target stakeholders/actors are Podcast Guest and Show Host.

2. Functional Requirements

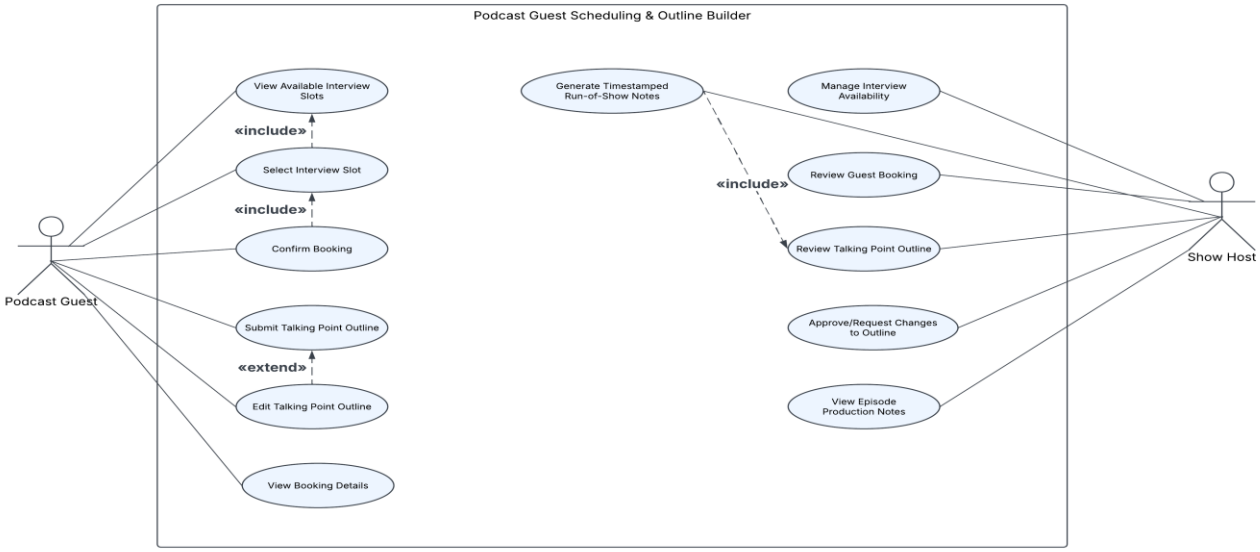

ID	Type	Description	Priority	Acceptance Criteria	Rationale
FR-001	Functional	Allow a Podcast Guest to view the Show Host's available interview time slots.	High	Available slots are displayed; unavailable/blocked dates cannot be selected.	Directly supports the stated requirement for guest booking availability.
FR-002	Functional	Allow a Podcast Guest to select an available interview time slot and submit the booking.	High	A valid available slot is booked; the selected slot becomes unavailable to other guests; a calendar invite is sent.	Completes the interview scheduling workflow described in the sample requirement.
FR-003	Functional	Allow a Podcast Guest to submit structured bullet points for the discussion/topic outline.	High	The outline is saved against the scheduled episode and is visible on the episode board.	Supports collection of guest talking points for episode preparation.
FR-004	Functional	Allow the Show Host to review and edit the submitted topic outline before the interview.	Medium	The host can view the submitted points, make changes, and save the updated outline.	Provides the host with control over episode preparation while preserving the guest's submitted topics.
FR-005	Functional	Generate timestamped run-of-show episode production notes from the approved topic outline.	High	The system produces formatted production notes containing ordered topics and timestamps.	Matches the problem context requirement to generate timestamped run-of-show production notes.

3. Non-Functional Requirements

ID	Type	Description	Priority	Acceptance Criteria	Rationale
NFR-001	Performance & Security	The system shall generate formatted run-of-show production notes from submitted guest topics within 1 second under normal operating conditions, while restricting booking and outline data to authorized users.	High	Performance testing confirms the target response time under representative load; unauthorized users cannot access or modify booking/outline data.	The source specifically identifies performance and security as important qualities for the outline generator.
NFR-002	Usability & Reliability	The system shall provide a clear booking and outline-submission workflow and preserve successfully submitted booking and outline data without unintended loss.	Medium	A representative user can complete booking and outline submission without ambiguity, and saved data remains available after a normal session restart.	A simple, reliable workflow is necessary for a media production organizer used by guests and hosts.

4. UML Use-Case Diagram

The diagram models the two actors specified in the problem statement: Podcast Guest and Show Host. The model includes <<include>> relationships for mandatory supporting behavior and an <<extend>> relationship for optional editing of a submitted outline.

5. Use-Case Flow Specification

Core Use Case: Book Interview Slot and Submit Topic Outline

Use-Case ID	UC-01
Primary Actor	Podcast Guest
Supporting Actor	Show Host
Goal	Book an interview slot and provide structured discussion points for episode preparation.
Preconditions	The Podcast Guest can access the system. The Show Host has published interview availability. The episode/booking period is open.
Postconditions	A valid interview slot is booked, the slot is no longer available, a calendar invite is generated/sent, and the guest's structured topic outline is attached to the episode board.

Main Success Scenario

1. 1. Podcast Guest opens the booking page.
2. 2. System displays the Show Host's available interview time slots.
3. 3. Podcast Guest selects an available time slot.
4. 4. System checks that the selected slot is still available.
5. 5. System confirms the booking and marks the slot as booked.
6. 6. System sends/generates the calendar invitation for the interview.
7. 7. Podcast Guest enters structured bullet points for the discussion.
8. 8. System validates and saves the topic outline against the episode.
9. 9. System displays the saved outline on the episode board.
10. 10. The booking and outline submission are completed successfully.

Alternate Flow – Selected Slot Becomes Unavailable

11. At Step 4, the system detects that another booking has already taken the selected slot.
12. The system rejects the booking attempt and informs the Podcast Guest that the slot is no longer available.
13. The system displays the remaining available slots.
14. The Podcast Guest selects another available slot and continues from Step 4.

6. Traceability Summary

FR-001 and FR-002 cover booking availability and slot selection; FR-003 covers structured guest talking points; FR-004 supports host review/editing; FR-005 covers timestamped run-of-show notes. NFR-001 addresses the performance/security emphasis in the source, while NFR-002 adds usability and reliability as supporting quality constraints for the described organizer.
